Outline of the Presentation

- Abstract
- Introduction
- Problem Statement
- Project Flow Diagram
- Objectives with Justification
- Modules[Frontend web pages]
- Expected Outcomes of the Proposed Work
- Conclusion
- References

Abstract

- The Organ Donation Registry UI is a healthcare web application designed to streamline the organ donation process. The system allows users to register as organ donors, upload consent forms, track donation status, manage donor-recipient matching, and coordinate transplant workflows. The platform improves transparency, efficiency, and communication between donors, recipients, hospitals, and healthcare coordinators.

Introduction

- Organ donation is a life-saving medical procedure that helps patients suffering from organ failure. Traditional donation systems often face challenges such as manual record management, delayed communication, and inefficient matching processes. The Organ Donation Registry UI provides a digital solution that enables donor registration, consent management, recipient matching, status tracking, and transplant coordination through a user-friendly web interface.

Problem Statement

- Current organ donation systems rely heavily on manual processes, resulting in delays, data inconsistencies, and lack of transparency. There is a need for a centralized digital platform that can efficiently manage donor information, consent documentation, recipient matching, and transplant coordination while ensuring data security and accessibility.

Project Flow Diagram

Objectives with Justification

- Objective 1
- Develop a secure donor registration system.
- **Justification:** Ensures accurate collection of donor information.
- Objective 2
- Implement consent form management.
- **Justification:** Maintains legal compliance and documentation.
- Objective 3
- Provide donor-recipient matching functionality.
- **Justification:** Speeds up the transplant process.
- Objective 4
- Track transplant workflow status.
- **Justification:** Improves transparency and monitoring.
- Objective 5
- Generate reports and export data.
- **Justification:** Assists healthcare administrators in decision-making.

Modules [Frontend web pages]

- CO1 — Front-End Architecture & Framework Design
- **Module 1: Home Page** — Displays platform overview, agriculture services, and navigation using React components.
- **Module 2: User Authentication** — Login/Signup pages with component-based UI and local storage for session management.
- CO2 — JavaScript ES6+ & Modular Architecture
- **Module 3: Product Marketplace** — Uses ES6 features such as arrow functions, arrays, objects, filter(), map(), and modular JavaScript structure.
- **Module 4: Search & Category Navigation** — Implements dynamic search, sorting, and filtering using modern JavaScript methods.
- CO3 — React Component Model & Controlled UI
- **Module 5: Farmer Dashboard** — Uses React functional components, props, and hooks (useState, useEffect) for product management.
- **Module 6: Product Registration Form** — Controlled forms for adding crop details, quantity, price, and availability.

Modules [Frontend web pages]

- CO4 — State Architecture & Data Engineering
- **Module 7: Supply Chain Tracking** — Context API manages product movement data across farmers, distributors, and retailers.
- **Module 8: Order Management** — Global state management for orders, inventory updates, and transaction records.
- CO5 — Routing, Forms, Accessibility & Performance
- **Module 9: Logistics & Delivery Tracking** — React Router enables SPA navigation between tracking, orders, and dashboard pages.
- **Module 10: Analytics Dashboard** — Optimized rendering, validation, and performance improvements for reports and statistics.
- CO6 — Build Systems, Testing & Deployment
- **Deployment Module** — Application packaged using npm, optimized React build process, tested for functionality, and deployed through Netlify/Vercel.
- **Production Environment** — Supports scalable deployment, responsive design, and maintainable project structure.

Expected Outcomes of the Proposed Work

- Efficient donor registration process.
- Secure storage of donor information.
- Faster donor-recipient matching.
- Improved transplant coordination.
- Real-time status tracking.
- Reduced paperwork through digital consent management.
- Better communication among healthcare teams.
- Generation of reports and analytics.

Conclusion and Future Scope

- The Organ Donation Registry UI provides a modern and efficient platform for managing organ donation activities. By digitizing donor registration, consent management, recipient matching, and transplant coordination, the system enhances operational efficiency and helps save more lives through timely organ transplantation.
